Fusion splicing Wikipedia

Fusion splicing is the act of joining two optical fibers end-to-end using heat. The goal is to fuse the two fibers together in such a way that light passing through the fibers is not scattered or reflected back by the splice, and so that the splice and the region surrounding it are almost as strong as the intact fiber. The source of heat is usually an electric arc, but can also be a laser, or a gas flame, or a tungsten filament through which current is passed.

Fusion Splicer Fiber Optic Fusion Splicing Machine

Since splicing fiber optic cables together is a much more complex process than splicing metal wires, it works together with the fiber cleaver to meet the end need. Before fiber optic fusion splicing, we need to cut the fiber optic cable and take away all fiber cable jackets, then use fiber optic cleaver to make the fiberglass end face ready, after finishing these work we can use the fiber fusion splicer to melt the two fiber glass together.
