Stem Cell Culture Media and Reagents Thermo Fisher

Hematopoietic stem cells expressing CD34 (CD34+ cells) are defined by their ability to replenish all blood cell types and to self-renew. Gibco StemPro-34 SFM is a serum-free medium specifically formulated to support the culture of these stem cells, and offers a superior expansion and differentiation of HSCs isolated from bone marrow, peripheral blood, or neonatal cord blood over traditional culture systems.

Stem Cell Culture complete xeno free culture media BI

Expanding the culture of excellence. Successful culture of stem cells requires optimized protocols that incorporate high quality, xeno-free reagents. hESC and hiPSC research is one of the most dynamic fields in modern biology, but cell-based clinical applications are currently limited by xeno-contamination during the in-vitro derivation and

Basic pluripotent stem cell culture protocol StemBook

The culture of human pluripotent stem cells shares many of the same protocols as standard mammalian cell culture. However, the successful culture and maintenance of human pluripotent stem cells (hPSCs) in an undifferentiated state requires additional considerations to ensure that cells maintain their key characteristics of self-renewal and pluripotency.
